

Spectral fingerprint of the geographic shift (local tiles=MS+RGB; $P_{33}=4.2^\circ\text{E}$)

Mean true-color channels by class: source vs target (P_{33} cut)

Per-tile greenness distributions: source vs target (seeded subsample)

Illustrative subsample (≤ 80 tiles/class/side); not a new experiment. source $n=18090$, target $n=8910$.
